PROFESSIONAL SUMMARY

Investigation assistant at LabOPT.cl, UTFSM. System-focused Telematics Engineering Student (3rd year, up to date) with a strong foundation in backend architecture and systems integration. Passionate about designing robust, data-centric systems and automation of processes. With experience in relational database modeling, backend web development, networking. Currently transitioning towards enterprise-grade backend development. Other interests: C2 Systems, defense.

EDUCATION

Universidad Técnica Federico Santa María (UTFSM) *Expected December 2029*
B.S. in Civil Telematics Engineering *Weighted Average: 81 / 100*

RELEVANT COURSEWORK

Software & Data	Software Design and Analysis (INF236), Databases (INF239), Object-Oriented Programming (ELO329) Cryptography (TEL252 - Currently in progress)
Networking	Computer Networks Laboratory (TEL241)

TECHNICAL STRENGTHS

Frameworks	Django,
Tools & Infrastructure	Linux, Docker, Git
Backend & Systems	System Architecture, REST APIs
Databases	PostgreSQL (Schema design, relational modeling)
Languages	Python, C++, SQL, Java

PROJECTS

WebSOS — Platform Architecture & Data Modeling — Currently in production
Full-Stack System Architecture *Python, Django, PostgreSQL, Docker, TailwindCSS, DaisyUI*

- Architected and developed a full-stack platform to standardize the flow of data, from gathering to analytics, with an evangelic organization as client *ad honorem*.
- Designed the relational schema and implemented it over PostgreSQL RDBMS, following strict normalization strategies and referential integrity to manage user hierarchies.
- Developed modular backend logic to ensure a clean and scalable project that covers all the required areas, from branding, media content to data gathering and crunching.

Plazas Inteligentes (LabOPT Project) — Scalable Telemetry & Gateway Architecture — Ongoing project
Distributed Urban Telemetry *Python, C++, Linux Gateways, Cloud Oriented*

- Architecting a data collection pipeline that comprehends hardware interfacing, creation of performant and efficient runtime in C++, cloud control and telemetry.
- This project aims to coolect sensor data and images from the environment, to be processed in cloud, within the context of parks; useful for architects, municipal managers, landscapists and others.
