PROFESSIONAL SUMMARY

System-focused Telematics Engineering Student (3rd year) with a strong foundation in backend architecture and systems integration. Passionate about designing robust, data-centric systems capable of handling real-time telemetry and high-volume transactions. Experienced in relational database modeling, system design, and building resilient architectures. Currently transitioning towards enterprise-grade backend development (Java/Spring Boot) and microservices.

EDUCATION

Universidad Técnica Federico Santa María (UTFSM)

B.S. in Civil Telematics Engineering

Expected December 2029

Weighted Average: 81 / 100

RELEVANT COURSEWORK

Software & Data	Software Design and Analysis (INF236), Databases (INF239), Object-Oriented Programming (ELO329)
Networking	Computer Networks Laboratory (TEL241)

TECHNICAL STRENGTHS

Backend & Systems	System Architecture, REST APIs
Databases	PostgreSQL (Schema design, relational modeling)
Languages	Python, C++, SQL (<i>Learning Java / Spring Boot</i>)
Frameworks	Django, Express.js, React
Tools & Infrastructure	Linux, Docker, Git, System Observability

PROJECTS

WebSOS — Platform Architecture & Data Modeling

Full-Stack System Architecture

Python, Django, PostgreSQL, Docker

- Architected and developed a full-stack platform for institutional process management, focusing on data consistency and process automation.
- Designed the relational schema and implemented it over PostgreSQL RDBMS, following strict normalization strategies and referential integrity to manage user hierarchies.
- Developed modular backend logic to ensure reliability and efficient data retrieval for process tracking.

Plazas Inteligentes — Scalable Telemetry & Gateway Architecture

Distributed Urban Telemetry

Python, C++, Linux Gateways, Cloud Sync

- Architecting a distributed data collection pipeline for urban telemetry, collaborating with municipal and academic stakeholders.
- Implementing a high-availability runtime with C++ for the Raspberry Pi 5 SBC, collecting and routing sensor data and telemetry toward a cloud environment.
