PROFESSIONAL SUMMARY

Research Assistant at LabOPT (UTFSM) and 3rd-year Telematics Engineering student in good academic standing, specializing in backend architecture and systems integration. Passionate about designing robust, data-centric systems, distributed telemetry, and process automation. Proven hands-on experience in relational database modeling, backend web development, and networking. Focused on building scalable, enterprise-grade backend systems, with strong interest in C2 (Command & Control) systems and defense technology.

EDUCATION

Universidad Técnica Federico Santa María (UTFSM) *Expected December 2029*
B.S. in Telematics Engineering (Computer & Network Engineering) *Weighted Average: 81 / 100*

RELEVANT COURSEWORK

Software & Data	Software Design and Analysis (INF236), Databases (INF239), Object-Oriented Programming (ELO329), Cryptography (TEL252 – In progress)
Networking	Computer Networks Laboratory (TEL241)

TECHNICAL STRENGTHS

Languages	Python, C++, SQL, Java
Backend & Architecture	System Architecture, RESTful APIs, Django
Databases	PostgreSQL (Relational modeling, schema design, strict normalization)
Tools & Infrastructure	Linux (Gateways & Server Admin), Docker, Git
Spoken Languages	Spanish (Native), English (Advanced – C1 Level)

EXPERIENCE

LabOPT – Multidisciplinary Research Lab in Optimization & Applied Computing Ongoing
Research Assistant – Scalable Telemetry & Gateway Architecture *Santiago, Chile*

- Architecting a distributed urban telemetry pipeline (*Plazas Inteligentes*) encompassing hardware interfacing, a high-performance C++ runtime on Linux gateways, and cloud-oriented data processing.
- Designing edge-to-cloud ingestion workflows to collect environmental sensor metrics and imagery across public parks, enabling data-driven analytics for urban planners, architects, and municipal managers.

PROJECTS

WebSOS — Platform Architecture & Data Modeling In Production
Full-Stack System Architect (Pro Bono) *Python, Django, PostgreSQL, Docker, TailwindCSS, DaisyUI*

- Architected and deployed a containerized full-stack platform for a non-profit organization to standardize end-to-end data workflows, from field collection to analytics.
- Engineered the relational schema in PostgreSQL following strict normalization strategies and referential integrity constraints to manage complex multi-tier user hierarchies.
- Developed modular backend services in Django to ensure maintainability and scalability across core modules, including content delivery, identity management, and data aggregation.
